

MUSIC PLAYER

SKILLS REQUIRED:

Knowledge of Tkinter and Pygame

CREDITS:

LEVEL:3

DURATION:15 hours

WHAT YOU'LL LEARN:

With this Python project, you create a full-fledged music player with an interactive UI to play around with.

To be able to build this project you should have Tkinter and pygame installed on your device.

1. We will use Tkinter to render our application's menu and its buttons, as well as to load the music from files, and then to play, pause, and stop it using the pygame library. Also, Tkinter is a lightweight module and can be used to create cross-platform applications (the same code will work on Windows, macOS, and Linux).

2. In Python, Pygame provides an inbuilt method called mixer () which allows us to deal with sound files easily, i.e:

- loading and playing music
- pausing and unpausing music
- stopping the music file

Functions Used

- playsong: The active song is loaded from the list and played. When the user clicks “play”, the song is played.
- pausesong: If the user clicks “pausesong”, the song is paused. It is executed when the user clicks “pause”.
- stopsong: It stops the song. After clicking “stop”, it is executed.
- resumesong: It is used for resuming the required song. When the user clicks “resume” it is executed.
